

These systems allow light, from the camera axis by a diffused light, objects for inspection, avoiding shadows and reflections. It uses an opening of 150 x 150 mm and using LEDs of high luminosity, converting it into one with the highest luminosity system on the market. We offer the possibility of personalizing your axial lighting system, increasing or decreasing the quantity of light, making uniform the projected area, by using different wavelengths.

### LIGHTING MODES

#### DIFFUSE AXIAL LIGHT

As the light comes from the same axis of the camera, the projected shadow picked up by the camera because it's produced vertically. In shiny flat surfaces, the camera would see reflected its own objective if this method of lighting weren't used. So that, this equipment is indicated to check shiny flat surfaces and deep cavities.
